Rates Generator

Section overview Creating a New Rates Generator Optimization Options Adjust Options Advanced Options Quality Options Rules List Tab Creating New Rules

Section overview

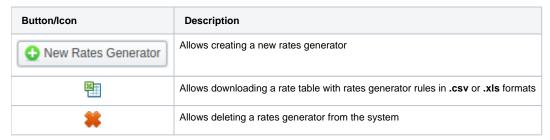

Rates Generator is a tool aimed at making rates management more flexible and versatile by allowing setting up specific rules that will be applied to codes and rate tables in general. Additionally, it allows both generating a new rate table for vendors or updating new ones. The section is presented in a form of a table with the following columns:

Screenshot: Rates Generator form

Column	Description	
ID	dentification number of a rates generator	
Name	Name of a rates generator	
Reseller	Name of a reseller, whom a rates generator belongs to	
Descripti on	Additional information about a rates generator	

Functional buttons/icons, presented in the section, are as follows:

Creating a New Rates Generator

To create a new rates generator, you need to click the New Rates Generator button and a pop-up creation form will appear. It consists of **general** and **additional** settings. The list of general settings includes the following fields:

Screenshot: General settings

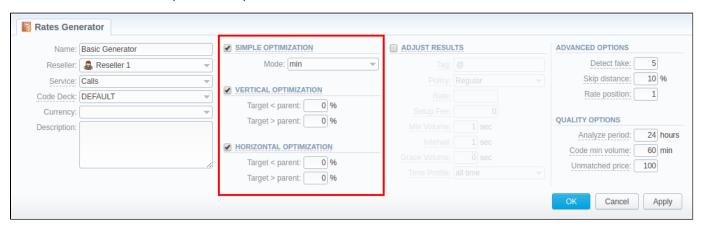

Field	Description	
Name	Specify the name of a new rates generator	
Reseller	Select the reseller, to whom a newly created rates generator should belong	
Service	Choose the service to be applied for the respective rates generator (calls, SMSs, data, etc.).	
Code Deck	Select the code deck that will be used to name destination codes in a new price list if the Adjust Results option is checked	
Currency	Specify the currency of rates in a new price list	
Description	Additional information about a current rates generator	

To refine your results, you can use the following additional criteria:

Optimization Options

Screenshot: Rates Generator form/Optimization sub-panel

Information Block	Descri	ption
Simple	It allows	applying the same price for all codes inside the same code name by using three options:
Optimization	• m in	minimum available price.
	• m ax	maximum available price.
	• a vg	average price of all available.

Examp

For instance, if the USA code name consists of 3 codes with 1, 5, and 6 USD rates, respectively, depending on a chosen option, the results

Code	Source Rate		Result Rate for min	Result Rate for max	Result Rate for avg
1201	1		1	6	4
1202	5	»	1	6	4
1203	6		1	6	4

Vertical Optimization

This option allows replacing the longer codes by the shorter ones within a Code Name.

Target Parent If a current rate is less of an entered percent, then it will be optimized. The longest codes will be merged to the shorter codes within the same

Target Parent If a current rate price is above an entered percent, then it will be optimized. The longest codes will be merged to the shorter codes within the

Examp

For instance, you have the USA code name that consists of 5 following codes: 120, 1201, 1202, 120345, 120456 with 1, 1.05, 0.98, 1.5, 0.6

Then, you need to specify the Target < Parent and Target > Parent fields: let's say 10% for each field. The Parent code is the shortest subcode within a Code Name (e.g., 120 is a sub-code for 1202, 1203, 1205 but not for 121, 1222, etc.). Thus, the boundaries for vertical optimization are 0.9 USD and 1.1 USD with parent's code rate of 1 USD. As a result, 1201 and 1202 codes will be merged into 120 code since they are located within the specified interval. On the other hand, 120345 and 120456 codes will remain unchanged. The resulting rate table with vertical optimization will have the following look:

Source Code	Source Rate	Target < Parent	Target > Parent		Result Code	Result Rate
120	1				120	1
1201	1.05			»		
1202	0.98	10%	10%			
120345	1.5	(0.9)	(1.1)		120345	1.5
120456	0.6		, ,		120456	0.6

Horizontal Optimization

This option allows applying the same rate to codes of the same lengths within a Code Name.

Target Parent If a current rate price is less of an entered percent, then it will be optimized. The price will be set for all codes with the same length within a

Target Parent

If a current rate price is above an entered percent, then it will be optimized. The price will be set for all codes with the same length within a respective code name.

Examp le

For instance, you have the USA code name that consists of 3 following codes: 120,120345,120456 with 1, 14, 15 rates, respectively.

Then, you need to specify the Target < Parent and Target > Parent with 5% and 10%. For this type of optimization, the system will check each code that matches the optimization rule (be of the same length) as a parent one. In our case, 120345 and 120456 will be checked. There fore, the boundaries for 120345 code will be 13.3 USD and 15.4 USD. Since 120456 code has 15 USD rate that matches the interval, its rate will be changed to 14 USD. As a result, the generated rate table will have the following look.

Source Code	Source Rate	Target < Parent	Target > Parent		Result Code	Result Rate
120	1				120	1
120345	14	5%	10%	»	120345	14
120456	15				120456	14

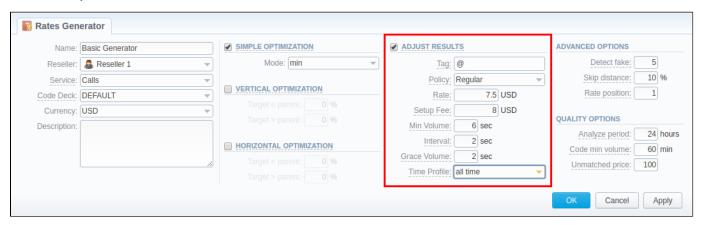

Attention

Please be advised that we don't recommend using all types of optimization within one rates generator. Simple optimization is designed to work solely, thus, no other type will work, if simple optimization is enabled. However, you can enable vertical and horizontal optimization within the same rates generator. Nevertheless, we recommend to enable only one type of optimization per rates generator.

Adjust Options

The *Adjust Results* checkbox enables results adjusting by data from a currently selected **Code Deck**. It means that the number of codes in your **source rate table** (specified in rules after a new rates generator is created) **must be equal** to the number of codes in your Code Deck. If your Code Deck has only 5 codes, but a rate table has 10, those extra codes, that are not specified in a selected Code Deck, will be removed from a generated rate table. On the other hand, if your Code Deck has 15 codes, but a rate table has only 5, 10 extra codes will be added to a generated rate table with parameters, specified in this information block. A detailed example is provided in the table below.

Screenshot: Adjust Results information block

Field	Description
Tag	Specify a tag that will be applied to new rates, if such were created by a rates generator. Let's leave the default @tag
Policy	Select the policy (regular or additive) that will be applied to a code(s), presented in a code deck, but not in a source rate table. For example, Re gular policy
Rate	Define a rate for codes, which are present in a code deck but missing in a rule's source rate table. For example, 7.5 USD
Setup Fee	Define a setup fee for a new rate(s). For example, 8 USD
Min Volume	Indicate minimum volume for a new rate(s). 6 sec, for instance
Interval	Specify the interval for a new rate(s). For example, 2 sec
Grace Volume	Determine grace volume for those rates. For example, 2 sec
Time Profile	Define a time profile for a new rate(s). For instance, leave the default all time profile

Examp

Let's say our DEFAULT code deck contains 5 codes: 1201, 1202, 1203, 1204, 1205. But our source rate table has 4: 1201, 1202, 1203, and 1205. If you enable Adjust Results and specify the above-mentioned fields with respective parameters, a new rate table, created by a rates generator, will consist of 5 codes: 1201,1202, 1203, 1205 with their original parameters and a new 1204 code with the following ones (see screenshot above):

Field	Value
Code	1204
Code Name	According to DEFAULT code deck
Rate	7.5
Setup Fee	8
Min Volume	6
Interval	2
Grace Volume	2
Time Profile	all time
Tag	@
Policy	Regular

If a source rate table misses more than 1 code from the selected code deck, all added codes will have identical parameters, specified in the respective fields above.

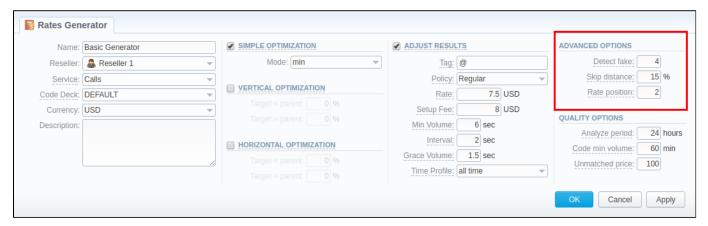

Attention

Please note, if you enable the Adjust Results option but don't specify the Rate field, new rates for missing codes won't be added to a new rate table

Advanced Options

The Advanced Options information block is designed to resolve cases when rates generator rules are created for different source rate tables that share certain identical codes. By specifying the following fields, you can configure what will the rate system use for these codes:

Screenshot: Advanced Options information block

Field	Description
Detect Fake	Enable detection of fake rates if at least a specified number of rates is present in all source rate table, specified in generator rules.
Skip Distance	A percentage value of difference between the average rate value and a particular rate from all rates, used for the Detect Fake operation.

Rate Position

Define what rate from a total amount of rates left after Detect Fake operation will be used for a certain code.

Rates are ordered from the cheapest to the most expensive. Thus, if you specify 1, The system will use the cheapest rate, if 2 - the second cheapest, and so on.

Example

Let's say we have 4 rules in our rates generator, each with a different source rate table. Each rate table has a rate for the 1201 code, but with different prices in USD:

Rate Table Name	Rate
RT 1	0.98
RT 2	0.2
RT 3	1.1
RT 4	1.7

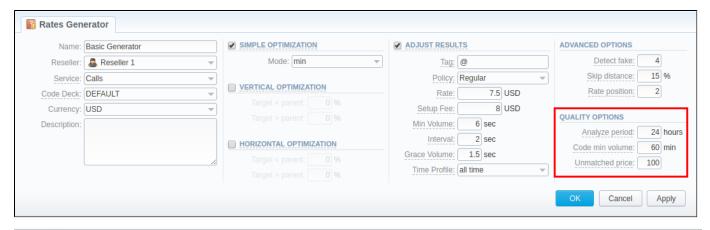

In **Advanced Options** of rates generator settings, we've specified values, seen on the screenshot above. It means that the system will pick **al I 4** rates for the **1201** code and execute the following actions:

- 1. Count an average rate for all 4 rates that equals 0.99 USD.
- Count the interval of 15% for average rate of 0.99 USD that is between 0.85 USD and 1.13 USD. Then, the system will compare all rates and skip 1.7 USD rate from RT 4 and 0.2. USD rate from RT 2.
- 3. Since the *Rate position* field value is 2, the system will pick the second cheapest rate for this code that is 1.1 from RT 3 and apply it as a basic rate for 1201 code in a new rate table, created by a rates generator.

Quality Options

The Quality Options information block contains additional parameters for more precise rate generation, based on the Summary Report. The system will analyze the report taking into account a specified time interval, specified in a report, minimum event value for codes, specified in generator rules, as well replace rate values for unmatched codes, and will generate a new rate table or update an existing one including these parameters. The information block consists of the following fields:

Screenshot: Quality Options information block

Field	Description
Analyz e Period	Define a number of hours to analyze the Summary Report for. For example, 24 hours
Code Min Volume	Define a minimum event volume for a certain code. For example, 60 min for the Calls service
Unmat ched Price	Define a price for all codes that do not satisfy quality parameters (Code Min Volume value). For example, 100 USD

Example For example, you created a new rates generator and set up 3 rules for the following codes: 1201, 1202, 1205 with 1.5, 2.5, and 5.5 USD rates, respectively. In the Quality options, the respective parameters are the same as indicated in an example (see screenshot above). If you click either Generate To file, Create Rate Table or Update Rate Table buttons on May 16th, at, i.e., 3:25 PM, the rates generator will run a Summary Report with the following parameters:

Field	Value
Period	May 15, 15.25 PM - May 16, 3:25 PM
Code	1201, 1202, 1205
Total Volume	60

Subsequently, a report showed that the billed volume for 1201 code is 79 mins, 1202 - 49 mins, and 1205 - 61 mins. As a result, a newly generated rate table will contain the following data:

Code	Old Rate		New Rate
1201	1.5		1.5
1202	2.5	»	100
1205	5.5		5.5

Attention

If you want to use Quality Options for Rates Generator, you have to define a Terminator as a Source for a Rates Generator's rule.

Rules List Tab

When your rates generator has been created, you need to specify its rules. The Rules List tab consists of all rules, created for a target rates generator and is presented in a form of a table with the following columns:

Screenshot: Rules List Tab

Columns	Description	
Rates Filter	Code or Code Name, used in this rule	
Sources	Rate Tables or Terminators Names that serve as sources for this rule	
Margins	Amount of margin that will be applied to a rate if specified margin parameters are met	
Force Rates Settings	ce Rates Settings Additional information on a rate: Setup Fee, Grace Volume, etc.	

List of functional buttons, presented in the tab, includes:

Button/Icon	Description	
♣ Add Rule	Allows creating new generator rules	
Generate To File	Allows downloading a new rate table in .csv or .xls formats	
Create Rate Table	Allows creating a new rate table with data from respective rules that will be added to the Rate Tables section	

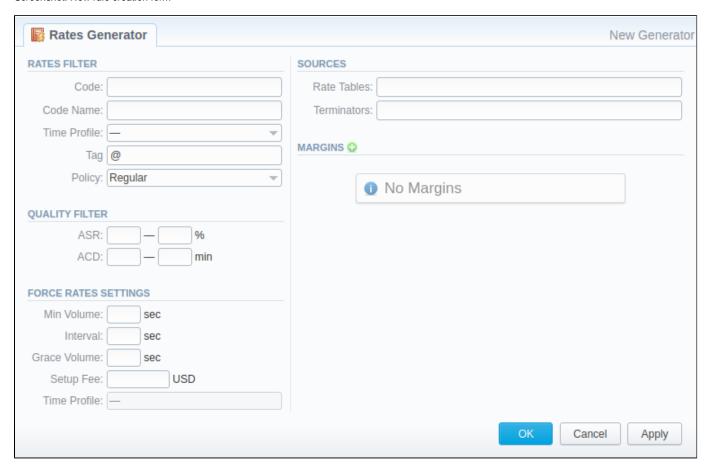

You can change an order of rules with the help of the 1 icon. Simply click on it and drag-and-drop it to a desired place.

Creating New Rules

To create a new rule, you need to click the **Add Rule** button. In the opened creation form (see screenshot below), specify the respective fields and click **OK** . A new rule will be added at the top of the **Rules List** tab:

Screenshot: New rule creation form

Fields and Description		
Basic paramete	ers of a new rule	
• Code	Indicate a code for a current rule. Use the * (asterisk) symbol for all codes. If a code is specified, the Code Name field is inactive and vice versa	
• Code Name	Specify a respective Code Name for this rule	
• Time Profile	Select a time profile for codes that will be picked from sources	
• Tag	Specify a tag for a current code of a rule	
	Code Code Code Name Time Profile	

	• Policy	Choose a respective policy (regular/additive)		
Quality Filter	Set quality parameters of your rule here			
	Attention Please be advised that these parameters work in combination with Quality Options in generator settings. It means that if ASR, % is set to 85-95, when a rates generator creates a Summary Report, it will analyze codes not only by their volumes, indicated in the Code Min Volume field, but also if their ASR complies with the value, indicated in the ASR, % field. The same behavior is expected for the specified ACD, min field			
	• ASR, %	Specify ASR ranges for target code that are checked in a Summary Report by the rates generator		
	• ACD, min	Specify ACD ranges for target code that are checked in a Summary Report by the rates generator		
Force Rates Settings	Specify additional parameters that must be noted when picking destinations from sources: • Setup Fee • Min. Volume • Interval • Grace Volume • Time Profile			
Sources	Select one or m	ultiple sources for picking data for a new price list		
	• Rate Tables	Specify source rate tables		
	• Terminat ors	Specify vendors (termination clients) for this rule		
Margins	By clicking on the	ne 👽 icon, you can add a margin to a respective rate.		
	If the rate for an indicated code is within the range of rates, defined in the <i>Rate></i> and <i>Rate</i> fields, a margin (specified in respect currency or %) will be applied to this rate. Add the % symbol to the <i>Add Margin</i> field value to indicate that a margin is in percentage.			

Section rules abide the following priority: the top placed rule is picked first, and if some of the lower priority rules are able to provide the same codes, those codes will be ignored.

Attention

Rates Generator generates stashed rates that must be confirmed. When you confirm rates and there are duplicate active rates, it changes the status of an active rate to stashed, and a new confirmed rate (created by a rates generator) becomes active. You can confirm rates in the Rate Tables section.
